1 Introduction

General introduction. Text.	This is a todo
General introduction. Text.	This is a warning
General introduction. Text. General introduction. Text.	This is a waiting
deficial introduction. Text.	This is a request
1.1 Purpose	This is an info

This document is the Requirement Analysis and Specification Document for the Customers Line-Up system. The purpose of this document is to describe the system focusing on scenarios, use cases, requirements and specifications, analyzing what the software will do, how it will be used and the constraints under which it will operate. This document is intended both for users and developers.

1.2 Scope

In recent times, it has become clear that avoiding gathering of groups of people in small spaces is critical for the safety of the population. During lockdowns some places become more crowded than others. This reason lead to the development of various solutions, all resulting roughly in restricting the capacity of a building, without having a real knowledge of the number of people inside (as ofter required by the law).

A definitive and well-articulated system is still missing, especially considering that most people aren't much tech-savvy, and especially elderly aren't familiar with the Internet.

The proposed system will focus on solving the problem posed by queues in front of groceries stores but it could be generalized for queues handling in multiple scenarios.

Customers Line-Up (CLup) is a system that allows supermarket managers to regulate the influx of people inside physical stores and giving customers a way to drastically reduce (or remove completely) the time spent waiting in a queue. The idea of CLup is being more akin to an open-source framework that can be adoped and improved, rather than it being a closed-source product.

This tool reaches the goal by offering a number of functionalities, including:

- · access to the service via mobile app or website
- · physical alternatives for people that do not have Internet access
- · monitor and dynamically restrict the amount of people allowed in a store
- · book a visit, notifying customers of any change in the schedule
- · suggest alternative stores and/or time frames
- · track the time spent in the store by customers to provide better estimate of waiting times

1.2.1 Current System

While there are already existing similar services, some are usually independent from store chains and therefore have limited functionalities. Notable examples are:

- *Ufirst* allows customers to virtually get a number and get notified when it's their turn, offers an app for store managers and a tablet app for totems where a customer without a smartphone can get a ticket. Stores are required to register to make use of the service.
- FilaIndiana allows customer to know how many people are in queue in front of a store by using GPS data from its userbase. Doesn't allow to book because it's indipendent from store chains. It's similar to what Google Maps offers with location-based crowd prediction.
- *QuandoSpesa* works similarly to *FilaIndiana*, but allows users to select a certain time slot that is guaranteed to be the less crowded for all the app users.

CLup is a service that supermarket chains can implement alongside their existing services. The system is as independent as possible from existing infrastructures, and it can be used with minimal setup.

here we include an analysis of the world and of the shared phenomena

relevant statistics https://www. istat.it/it/ archivio/216672

1.2.2 Goals

- [G1] Allow a User to sign up for an Account after providing a mobile phone number.
- [G2] Allow a User to book a visit to a specific store.
 - (a) Allow a User to book a visit via Mobile App.
 - (b) Allow a User to book a visit via Website.
 - (c) Allow a User to book a visit in a specified time.
 - (d) Allow a User to book a visit as soon as possible.
- [G3] Allow a User without Internet access to retrieve a ticket from a physical location that counts as a reservation for a certain time.
- [G4] Allow a User to find Stores nearby their current location.
- [G5] Allow a User to find Stores nearby a specified location.

Merge with above?

- [G6] Allow a User to preview an estimate of the queue time.
- [G7] Allow a User to cancel their reservation.
- [G8] Allow a User to retrieve a scannable QR Code/Barcode that they must present in order to be granted access to a store.
- [G9] Allow a User to book for someone else.
- [G10] Allow a User to link their Account to the Store Loyalty Program.
 - (a) Users without an Account are not entitled to this feature.
- [G11] The System notifies the Users affected by delay.
- [G12] The System shall postpone Users visits in case of a delay.

Are we sure about this?

- [G14] The System must enforce the limits on the allowed number of concurrent Customers inside a store.
- Isn't this a requirement?

- (a) There can be less Customers than the limit.
- (b) There cannot be more Customers than the limit.
- (c) The queue is updated each time a Customer exits or enters the store.

[G13] The System shall not anticipate User visits when a User delete their reservation.

- [G15] The System shall not admit Users that arrive earlier, even if the current number of Customers isn't maximum.
- [G16] The System shall grant a User access only after the User's time of reservation.

Merge with above?

- [G17] The System shall invalidate a User's reservation if they do not show up during a certain time interval.
- [G18] The System shall reserve a certain number of the allowed quote of customers for a special category of Users.
 - (a) The system shall grant priority access to Users without a reservation that show up at the store and are pregnant women, elderly or with disabilities.
- [G19] Allow System Managers to set a limit to the people allowed into the store at a time.
- [G20] Allow System Managers to not provide the physical ticket option.
- [G21] Allow System Managers to enable the functionality that allows customers to link their Account with Loyalty Program feature.

1.3 Definitions, Acronyms, Abbreviations

1.3.1 Definitions

- Customer (also User or Visitor): A person that intends to shop at a store.
- · Registered User: A User that has registered an Account within the System.
- System Manager: A stakeholder (owner, employee, manager etc.) of the Store chain that can tweak the parameters of the System and access informations and statistics.
- Account: A reference to a specific User in the System, that allows to track the User across multiple visits.
- Reservation (or Booking): Arrangement made between a User and the System in which the System shall grant the User access to Store at the arranged time.
- Visit: The time frame in which the User enters the store, shops and exits.
- Time slot: The time at which a Customer with a Reservation is expected arrive at the store.
- Store: Any physical location (e.g.: building) where it is possible to utilize the System.

1.3.2 Acronyms

- · RASD: Requirement Analysis and Specification Document.
- · API: Application Programming Interface
- · CLup: Customer Line-up

1.3.3 Abbreviations

- [Gn]: n-goal.
- [Dn]: n-domain assumption.
- [Rn]: n-functional requirement.

1.4 Revision History

1.5 Reference History

Problem Specification Document: "Assignment AY 2020-21.pdf"

Should we upload it?

• https://standards.ieee.org/standard/29148-2018.html

1.6 Document Structure

The document is structured in three sections:

- In the Introduction we provide a brief explanation of the problem, what the proposed solution consist of and how it differs from existing systems, reference for used resources, language and revisions.
- In the second section, we provide an overall description of the product and its functions, with the help of scenarios to illustrate various situations. We also analyze the possible userbase of the service and then base assumptions and constraint upon them.
- In the third section we explain the more technical details by analyzing the software, hardware and user interfaces with the help of UML diagrams (sequence, activity) and mockups. We explore also aspects related to reliability, availability, security, maintainability and portability. We also analyze formally the proposed models with the help of the Alloy Tool.

2 Overall Description

2.1 Product Perspective

here we include scenarios and further details on the shared phenomena and a domain model (class diagrams and state charts)

Customers Line-Up is developed for both shop managers and customers. The intent is to provide functionalities adding value to the interactions between the two. Managers have access to a website that will help them to avoid large crowds inside and outside their stores, providing them with useful analytics. Customers may avoid queues by booking visits to stores via website or mobile application, and will be guided in selectiong the best place and time. Customers must register an account in order to utilize the website or the mobile app. Customers who do not possess an Internet-connected device may still utilize the service via physical totems outside the stores.

The system will be developed from scratch, giving great flexibility and scalability. The privacy of the customers will be guaranteed according to the latest privacy related norms.

2.1.1 Scenarios

A. Customer with the mobile app arrives in time

lan wants to buy groceries to make a cake. Ian uses CLup to get a ticket for the supermarket with the shortest queue in his area. The app provides Ian with an estimate on the travel time (by car or by foot) and the time of the reserved slot. Ian arrives at the supermarket in the correct time slot, scans a code generated by the app and is granted access the store. Once he pays for his groceries he scans again his code, so that he can increase the loyalty points associated with his store chain account.

B. Customer with no knowledge on the booking system

Pino is an elderly man. Pino knows nothing about Smartphones or Computers. Pino needs to buy a cake for his nephew's birthday party, so he decides to go to the local supermarket. When he arrives, he notices that the doors of the supermarket aren't opening. He reads the sign pointing him to a totem. As soon as he approaches the machine, the machine activates itself an starts speaking with a reassuring voice. The machine allows Pino to book a reservation to enter the store and instructs Pino on how to do so. As soon as the time is up, Pino places his ticket onto the reader beside the door of the store, and he is granted access.

C. Customer cancels the reservation

Luigi, after booking a visit to the store, remembers that he had a visit to the dentist at the same time. Since Luigi cares about others, he cancels his reservation, freeing up a time slot to be used by other customers.

D. Customer is unable to provide their code

Andrea books visit and reaches the store in time, but has forgot to charge his phone, which turns off as he pulls it out of his pocket in order to scan his code. Andrea goes at the totem, makes a new reservation, and receives a new code and a new time slot.

E. Manager adjusts the number of users allowed without reservation

Ada is a store manager that notices that most of the customers at her store are elderly and do not make use of the app. She also notices that very few customers actually use the app, and the system is reserving too many spots for customers using the app. She navigates to the web panel of the service, logs in with her credentials, and navigates to the correct section, then she increase the number of customers allowed without reservation. The system automatically decreases the number of customers allowed by booking with the app.

2.2 Product Functions

The functions of Customer Line-Up can be clearly divided in two categories, based on the type of the stakeholder that is being addressed.

fare dettagliato e numerare

2.2.1 Manager functions

The manager is the owner of the store or store chain that is using the system. The functions targeted at the manager regard the management of the queue and the knowledge of statistics about the behavior of the clients. The system will let managers select the type of commercial exercise (whether single store or chain), manage independently every physical store, select the number of slots dedicated to reservation and the ones dedicated to a classical queue, as well as to create a high priority queue for special categories of people. At the same time the system will provide info about the number of people who are currently in a store, how the number of people changes over time and the average visit length.

2.2.2 Customer functions

The customer is the person who visits a store. The functions targeted at the customer regard the possibility of skipping queues. The system will let people book visits at specific time slots or queue up at the moment. If the user is in the queue, they will be updated live with their estimated time of entrance in the store. If the user has booked a visit, they will be notified immediately if the system realizes that their visit has become unfeasable and automatically assign a new time or, in the worst case, cancel completely the visit. The system will offer the possibility of creating an account and of logging in. Users using their personal accounts will be able to check their past history.

2.3 User Characteristics

Customers Line-Up is mainly aimed at essential and widely used services. Because of this its audience will be wide and diversified, and the system will be easy to use and accessible in several of ways, accounting in particular for people with disabilities or people who are not familiar with technology. On one side of the system there is the system manager (single or multiple), who will monitor how the system is used and obtain useful information. They are usually already familiar with othe customer relationship managers and already know what to expext from a control panel. On the other side there is the customer, who uses the system in order to avoid boring lines and to prevent contact with others. The main categories of customer are:

· Tech-friendly

People who are familiar with modern technologies. They find it easy to navigate the menus of a complex application. They are able to use the system in an autonomous way and are the ones who will benefit the most from the more complex and advanced features.

· Tech-unfriendly

People who are not familiar with modern technologies. They have problems navigating complex application, and are more accustomed to talking to humans. They might need aid using the system or misuse the system. They benefit from a system designed around clarity and simplicity, or from different, easier ways of using the system. This category includes people with disabilities.

The objective of Customers Line-Up is to be as inclusive as possible, providing utilities targeted at all possible users.

2.4 Assumptions, Dependencies, and Constraints

here we include domain assumptions

- [D1] The number of people in a store cannot go over a certain fixed amount
- [D2] If an user enters the store they will exit the store before it closes
- [D3] The system reliably counts the number of people entering and exiting the store
- [D4] The time of real operation of the store corresponds with the one registered in the system
- [D5] A customer cannot enter the store without using the system
- [D6] External software dependencies the system relies on always provide true data and never fail

Dobbiamo mettere che ci sono i tornelli o c'è una persona

3 Specific Requirements

Here we include more details on all aspects in Section 2 if they can be useful for the development team.

3.1 External Interface Requirements

- 3.1.1 User Interfaces
- 3.1.2 Hardware Interfaces
- 3.1.3 Software Interfaces
- 3.1.4 Communication Interfaces

3.2 Functional Requirements

Definition of use case diagrams, use cases and associated sequence/activity diagrams, and mapping on requirements

3.3 Performance Requirements

- 3.4 Design Constraints
- 3.4.1 Standards Compliance
- 3.4.2 Hardware Limitations
- 3.4.3 Any Other Constraint

3.5 Software System Attributes

- 3.5.1 Reliability
- 3.5.2 Availability
- 3.5.3 Security
- 3.5.4 Maintainability
- 3.5.5 Portability
